INTERSHIP PRESENTATION

2026–27

EXPENSE TRACKER PROJECT

MERN Full Stack Development With Project

Student	PRAGYA SINGH
Enrollment / Roll No.	25SCS1003000952
Program	B.Tech CSE · 3rd Semester
Batch	2025–29
Organization	EduSkills Foundation

Eight-week virtual internship with project work in modern web development.

Internship Overview

Program, duration, mode and learning scope

10 WEEKS

VIRTUAL

MERN FULL STACK

Internship Program

The internship was an ten-week virtual program in MERN Full Stack Development with Project, combining structured learning with project work.

Core Areas Covered

Core JavaScript and web concepts; React fundamentals and Hooks; state management; routing; Node.js and Express.js; MongoDB/Mongoose; REST APIs; JWT; Git workflow and deployment concepts.

PROJECT WORK

- Expense Tracker Project was explicitly included in the internship credential.
- The project focused on structured expense data processing and analysis.

Organization Profile

EduSkills Foundation

EduSkills Academy

EdTech & Skill Development

Virtual Internship Program

Industry-oriented web development exposure through structured virtual learning and project work.

PROGRAM CONTEXT

Mode

Online / Virtual

Domain

MERN Full Stack Development

Project

Expense Tracker

Mentor

Project Overview

Expense Tracker Project

What the project does

Records expense details in a structured form and performs basic spending analysis. Core operations include accepting entries, storing them, calculating total and monthly expense, and identifying the highest-spending category.

CORE FUNCTIONS

01 Accept Expense Entries
Parse Description, Amount and Category into expense objects.

03 Calculate Monthly Expense
Compare the year-month portion of the date and sum matching records.

02 Calculate Total Expense
Iterate through records and accumulate amounts.

04 Highest Spending Category
Aggregate amounts by category and find the maximum total.

Problem Statement & Objectives

Problem Statement

Unstructured day-to-day expense records make it difficult to understand where money is being spent and which categories contribute most to overall expenditure. The project addresses this through structured recording and simple analytical operations.

OBJECTIVES

- Record expense entries in a structured form.
- Parse input into expense objects.
- Calculate total expenditure.
- Calculate expenditure for a specified month.
- Aggregate expenses by category and identify the highest-spending category.
- Strengthen practical understanding of JavaScript data processing.

Technologies & Tools

Technologies covered during the internship and used/related to project work

JavaScript

Input parsing, arrays, objects, functions and expense calculations.

React

Frontend library covered as part of the MERN curriculum.

Node.js

JavaScript runtime covered for server-side development.

Express.js

Backend framework covered for web servers and REST APIs.

MongoDB / Mongoose

Database integration covered in full-stack applications.

REST APIs

Architecture covered for client-backend communication.

JWT

Authentication and authorization concepts.

Git / GitHub

Version control and development workflow.

System Architecture

Logical data-processing flow for the Expense Tracker

The project follows a straightforward flow: input → parsing → storage → processing → results.

Methodology & Implementation

Task-based incremental approach

Outcomes & Learning

Expected Outcomes

- Structured expense records
- Correct overall expense calculation
- Correct monthly expense calculation
- Correct identification of highest-spending category
- Improved understanding of JavaScript arrays and data processing

Learning Outcomes

- Input parsing and string manipulation
- Arrays and objects for data representation
- Iteration, filtering and accumulation
- Category-wise aggregation
- Breaking requirements into smaller testable functions
- Exposure to MERN-stack development concepts

Key Takeaways

What the internship added beyond the project

FULL-STACK EXPOSURE

- React fundamentals, Hooks, state management and routing.
- Node.js and Express.js for backend development.
- MongoDB/Mongoose for database integration.
- RESTful APIs and JWT-based authentication concepts.
- Git workflow and deployment concepts.

Internship Completion Certificate

EduSkills Foundation

The certificate confirms successful completion of the internship program and lists the Expense Tracker Project among the completed project work.

THANK YOU

Expense Tracker Project
